## **Review of "English translation" for events:**

- $A \cap B =$  "both events A and B happen"
- $A \cup B =$  "either event A or B (or both) happens"
- $A^c =$  "event A does not happen"

## Set Theory Rules: (try drawing Venn diagrams of these)

- Definition of set difference:  $A B = A \cap B^c$  "event A happens, but B does not"
- Associative Law:

	$(A\cup B)\cup C=A\cup (B\cup C)$
	$(A \cap B) \cap C = A \cap (B \cap C)$
• Commutative Law:	
	$A\cup B=B\cup A$
	$A \cap B = B \cap A$
• Distributive Law:	
	$(A\cup B)\cap C=(A\cap C)\cup(B\cap C)$
	$(A \cap B) \cup C = (A \cup C) \cap (B \cup C)$
• DeMorgan's Law:	
	$(A\cup B)^c = A^c \cap B^c$
	$(A \cap B)^c = A^c \cup B^c$

#### **Probability Rules:**

- Inclusion-Exclusion Rule:  $P(A \cup B) = P(A) + P(B) P(A \cap B)$
- Complement Rule:  $P(A^c) = 1 P(A)$
- Difference Rule:  $P(A B) = P(A) P(A \cap B)$

Exercise: Try deriving these rules from the definition of a probability function. Draw a Venn diagram to convince yourself they work.

#### **Conditional Probability:**

 $P(A \mid B) =$  "the probability of event A given that we know B happened"  $P(A \mid B) = \frac{P(A \cap B)}{P(B)}$ 

## **Multiplication Rule:**

$$P(A \cap B) = P(A|B)P(B)$$

**Tree diagrams** to compute "two stage" probabilities (B =first stage, A = second stage):

- 1. First branch computes probability of first stage: P(B)
- 2. Second branch computes probability of second stage, given the first:  $P(A \mid B)$
- 3. Multiply probabilities along a path to get final probabilities  $P(A \cap B)$

Example: You are given two boxes with balls numbered 1 - 5. One box contains balls 1, 3, 5, and the other contains balls 2 and 4. You first pick a box at random, then pick a ball from that box at random. What is the probability that you pick a 2?

## Sampling without replacement:

I have a box with 10 red balls and 10 green balls. I draw 2 balls from the box without replacing them. What is the probability that I get 2 red balls?

Let R1 = "first ball red" and R2 = "second ball red" and use product rule:

$$P(R1 \cap R2) = P(R1)P(R2 \mid R1) = \frac{1}{2} \times \frac{9}{19} = \frac{9}{38} \approx 0.24$$

If I draw 3 balls without replacement, what is the probability that they are all red?

$$P(R1 \cap R2 \cap R3) = P(R1 \cap R2)P(R3 \mid R1 \cap R2)$$
  
Multiplication rule for  $(R1 \cap R2) \cap R3$   
$$= P(R1)P(R2 \mid R1)P(R3 \mid R1 \cap R2)$$
  
Multiplication rule for  $R1 \cap R2$   
$$= \frac{1}{2} \times \frac{9}{19} \times \frac{8}{18} = \frac{18}{171} \approx 0.11$$
